

## HVAC Equipment Sizing

Determining the Right Size System for your Home

*“Beware of being sold an over-sized unit. An over-sized air conditioner will cycle on and off more frequently, causing noticeable temperature swings, higher energy costs and put more wear on the equipment.”*

-Consumer Reports

Determining the proper size heating and cooling system for your home is critical for your home’s comfort. Having an over-sized air conditioning unit will contribute to an excessive amount of humidity in your home and over-sizing your furnace can be equally as critical. An over-sized furnace will not properly heat your home and will have a lower life expectancy due to excessive cycling on and off.

Our Alpha Mechanical Service energy consultants are properly trained to determine the exact size of the heating and cooling equipment that is right for your home. We will perform a full heating and cooling load calculation (Manual J). You will have the peace of mind knowing that your comfort system will be perfectly sized for your home.
